

## QUALITY OF SERVICE IN A REMOTE TELEPHONE

5

### ABSTRACT OF THE DISCLOSURE

10 An information handling system comprises a TCP/IP network connected via a  
modem to an IP telephony device that is then coupled to a network device. Data sent  
from the network device is addressed for transmission through the IP telephony  
device to the TCP/IP network. The IP telephony device monitors when an amount of  
data being received over the network falls below a predetermined threshold. If this  
15 occurs, the IP telephony device will throttle data being received by the IP telephony  
device from the connected network device.
